

Tools for Lotus Notes and Domino®

ADDICTION 
MAY OCCUR.

Take the tedium out
of your IBM Lotus Notes
and Domino development
and administration!

Avoid time consuming and boring tasks
like adjusting all of your views and action
bars, changing item properties, resolving
conflicts and poring over your designs.

Change the way you work with Lotus
Notes. Develop, debug and administer
Notes applications quicker and easier
than ever before with Ytria's EZ Suite.

Ytria

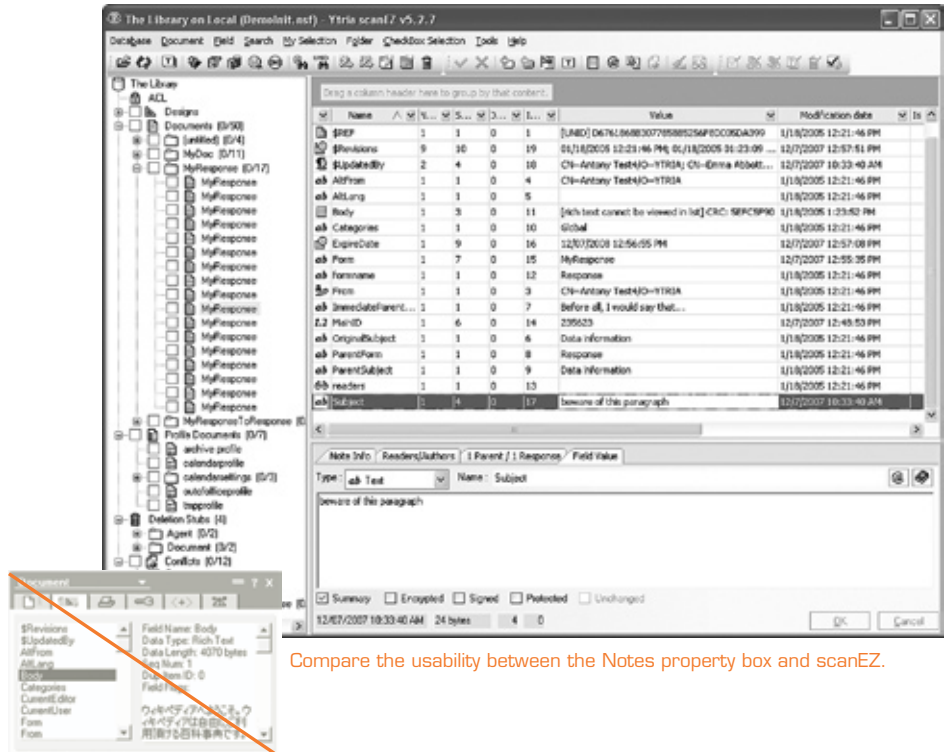

www.ytria.com

Did you ever wish you could see everything inside a Notes database, and instantly fix any problems you encounter? Tired of manually tracking down and fixing save or replication conflicts? Sick of writing agents and LotusScript to edit items? Need to compare and edit a large number of documents? Profiles? scanEZ has over one hundred tools to help you get a real grip on your Notes applications.

I bought scanEZ for the following reasons:

- > Easy accessibility to document fields and the ability to edit them
- > Easy access to profile documents
- > Bulk updating of a field in selected documents
- > Easy access to the Notes.ini
- > Side-by-side document comparison
- > Quick reply and reaction [from the Ytria team] to problems and requests

Theo Heselmans
Senior Consultant, Xceed

Compare the usability between the Notes property box and scanEZ.

Understand any Notes Database

Ytria scanEZ makes the whole structure of a Notes database a lot easier to understand. It just makes it that much simpler to see and analyze the inner workings of a Notes database.

Find the Answers You are Looking For

See data exactly as it is stored by Notes using a variety of different tools: Searches by Formula, NoteID, NoteID Range, UniversalID, or Full Text; the Document Analyzer, which helps you find elusive documents; the Deletion Stub Explorer to see what has been deleted.

What mattered to me is the combination of all tools in one. There are tools and hacks to see or copy replica IDs, to update fields and to resolve conflicts, but they are all separate. With scanEZ, you have it all under "one roof" and in a user-friendly way. In addition, the handling of deletion stubs came in handy for tracking down document deletions.

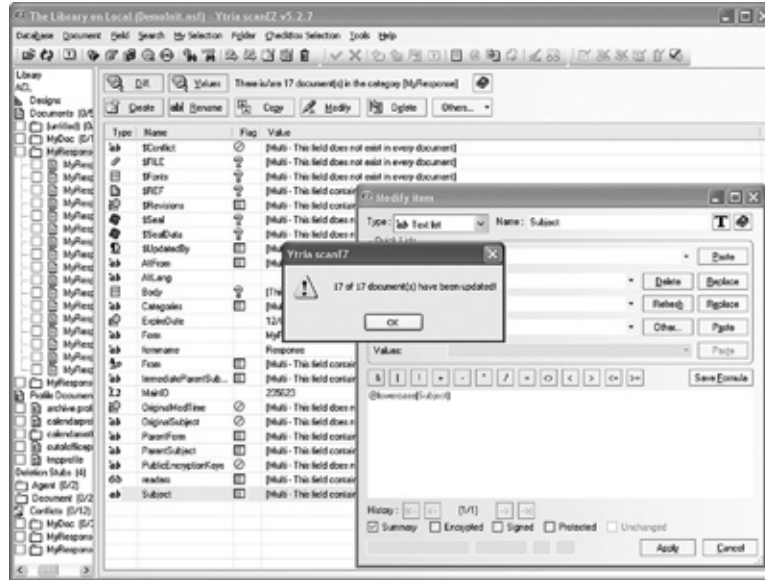

Gerald Mengisen
Lotus Notes Development, United Nations

Manipulate Documents

After finding documents you want to manipulate, actually changing them usually forces you to write and test code for an agent. Imagine being able to change anything you want in only a few mouse clicks.

I am very impressed with the product suite, particularly scanEZ which I have just installed since seeing it in action yesterday. Having spent years relying on half-baked solutions like NotesPeek, smarticon formulas, creating temporary agents and views etc, it's great to have so much functionality in one tool.

Jeff Gilfelt
 Developer – Lotus Notes Team,
 Panasonic Europe IT Group

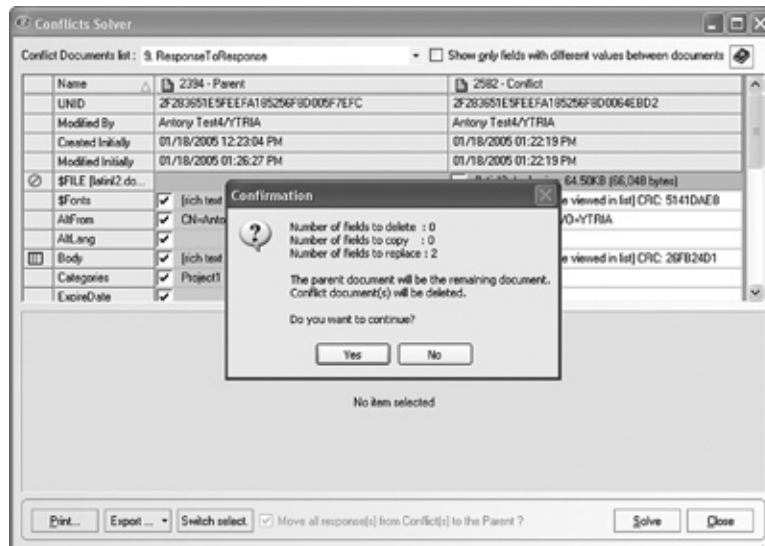

Take Control of Replication and Solve Conflicts

See and fix potential replication conflicts before they are created. For conflicts that do occur, instead of coding a view and/or agent to find conflicting items, scanEZ lets you find and solve conflicts as fast as you can click. Also, see the state of a database after a replication to track down any possible “ghosts” or resurrected documents.

How did we manage to survive in the past without scanEZ?

Bertil Knutsson
 Senior Programmer Analyst, SEB

ACL Server Solution

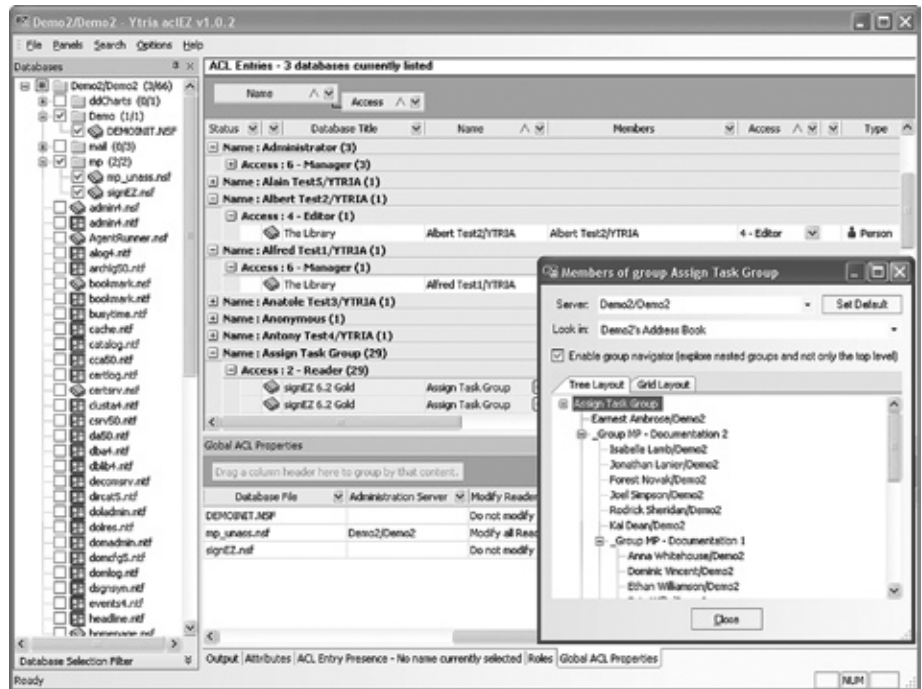

Do you need to see and mass modify all the ACLs on a server? With aclEZ, Domino administrators can quickly see and categorize ACLs on a server, analyze them for consistency and close security loopholes in an instant. You can also navigate and expand ACL groups to quickly see exactly who's inside them allowing you to fix problems right away. A time-saving tool for Domino administration.

We use aclEZ to quickly check for incoherences on our 50 servers.

For example, we use it to check if "Administration Server" is properly set on all of them in a few mouse clicks. We can correct problems right away, without returning to the Administrator client. We can also very quickly see where "Anonymous" is not set. This is much easier than verifying through "Catalog".

This is a great time saver when you have to deal with a lot of users and/or database moves.

Olivier Collon
Notes Administrator,
TOTSA – Total Oil Trading SA

Immediately See and Verify All ACL Settings on a Domino Server

With aclEZ you can see all the ACL entries for selected databases on a server and make sure that they are consistent. You simply cannot see all the ACLs on a server in Lotus Notes and Domino at the same time.

Find Missing ACL Entries and Fix Them

See exactly where an ACL entry is missing and quickly add new ACL entries right away. You can also select and copy an existing entry to fill in the ACL hole.

Expand Groups and See Who is Inside

See all members in an group, even with nested groups! A spreadsheet-like grid means you can see exactly which members are in which group. No more guessing required.

Apply Mass ACL Changes Across Databases on a Server

After finding your ACL problems you need to fix them. Using aclEZ, you can edit several ACL entries across several databases on a server all at once. You can also copy several ACL entries to several different databases all in one operation.

See the Global ACL Properties for all Databases

Easily access the ACL History logs and Advanced ACL properties for every database on a server. Also, modify the Administration Server and Enforce a consistent Access Control List properties for many databases all together.

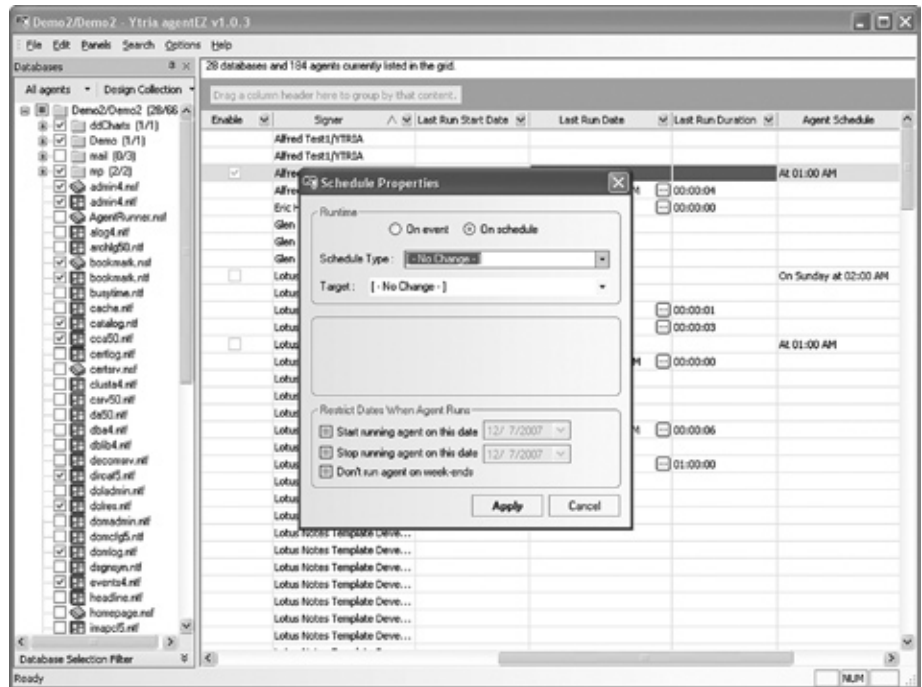

NAB Group Explorer

Easily browse through all the groups in your Notes Address Book and see exactly which members belong to which group (even nested groups).

Agent Server Solution

Have you ever wasted time tracking down an agent that's causing trouble on a server? Domino administrators can use agentEZ to collect agent information to instantly analyze agent properties, logs and signatures. With agentEZ, you can quickly and easily see the underlying causes of any agent problems. Let agentEZ help you see and control of all the agents on a server.

See All Agents on a Domino Server (Even if Not Scheduled to Run Today!)

With agentEZ, you can see all agents on a server, right away. You can also see just the scheduled agents (even if they are not set to run today) and other specific sets of agents.

An Organized View of Agent Properties and Mass Editing Capabilities

See and categorize ALL the agent properties: Schedule, Run On, Enable, Frequency, Signer, Runtime and more. With agentEZ you'll no longer need to open every agent in Domino Designer just to see the agent properties. When a change is needed, mass edit all your agent properties at once.

See Agent Runtime and the Load on Your Server

See the schedule of past and future agents. Know when agents are running, and how long they run.

Instant Access to Agent Logs

Ytria agentEZ gives you direct access to any agent log. This means you no longer need to painstakingly open every agent design and click your way through the Designer to reach the agent log option. All agent logs are immediately accessible with a dedicated log button; just click the one you want to open.

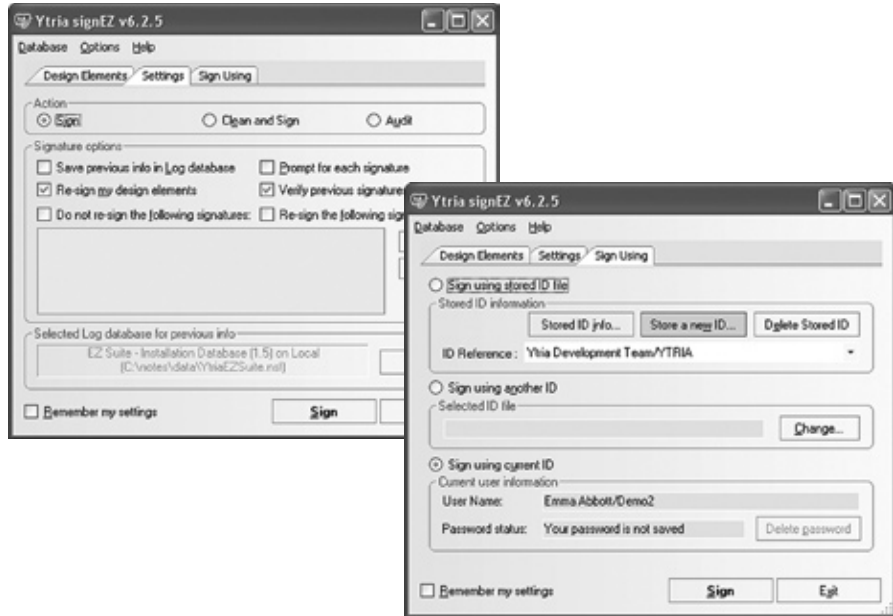

Design Signature Tool

Do you want to delegate the ability to sign design elements with a specific signing ID, but you don't want to give physical access to the ID? Need to sign specific designs in all your Notes applications? Ytria signEZ is the only way to see all your signatures as they really are.

The main reasons I use signEZ are:

- > I can sign only the elements that need to be signed. This is especially useful when a design change has been made to the mail template. This prevents a lot of replications (and questions) for the users.
- > I don't need to switch IDs to sign databases with another ID file.
- > Signing particular applications/multiple databases is very easy using the signEZ database.

Anton Soloviev
Notes Developer, Investsberbank

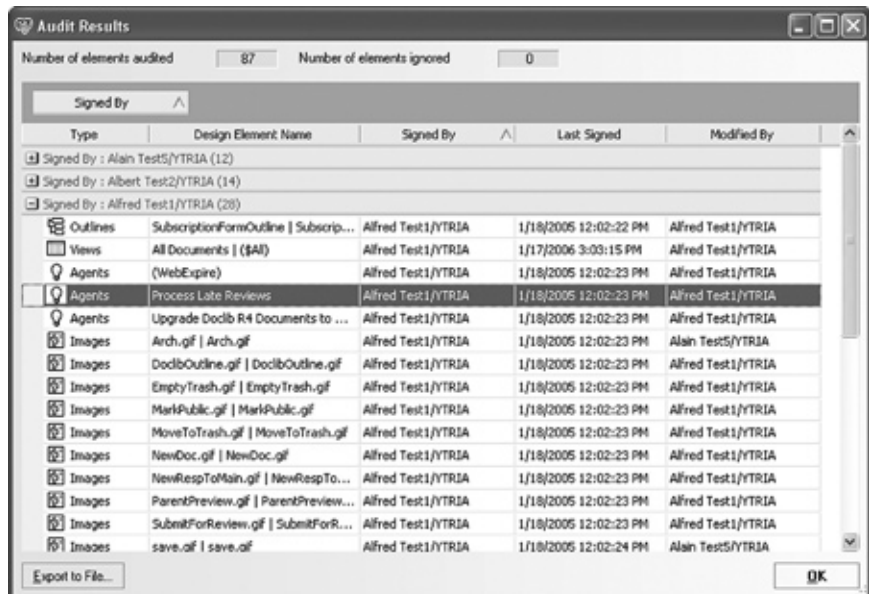

Total Signature Control

Take precise control: sign your database applications all at once, sign with the designated signing ID, and sign only the elements you want signed.

Delegate Signature ID Access

Securely store a special signature ID file and define who can sign with it and where.

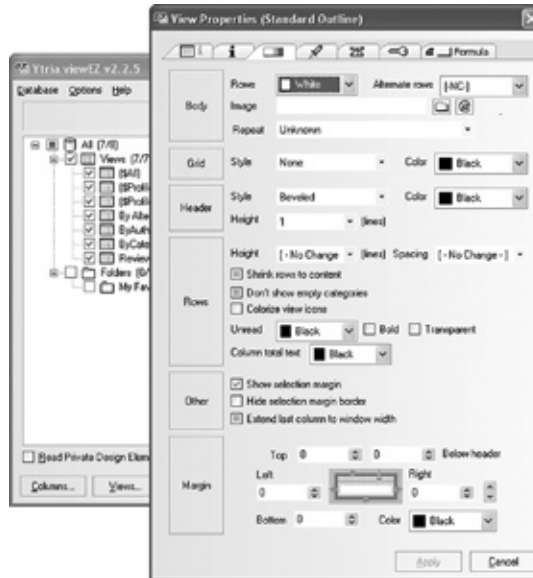

Quickly verify all design element signatures in a database.

Do you want to stop changing view properties (i.e. alternating row colors, fonts, etc) one at a time? Want to change many column formulas or column properties all at once? Stop painstakingly changing each view manually.

Ytria's viewEZ has saved me hundreds of hours! We have a suite of databases that make up our CRM and we were changing the properties on every single view (i.e. alternating row colors, fonts, etc). What would have normally taken most of a week for my entire team was cut down to less than an hour to do the entire suite of databases.

Neale A. Wooten
Notes Development Team Lead,
Senior Software Architect, Perceptive
Software, Inc.

Preview Your View

With a built-in view renderer you can take a quick look at a view you are developing (using any selection of sample documents). You no longer need to wait for the view to refresh, or to make a template design refresh every single time.

Total View Property Control

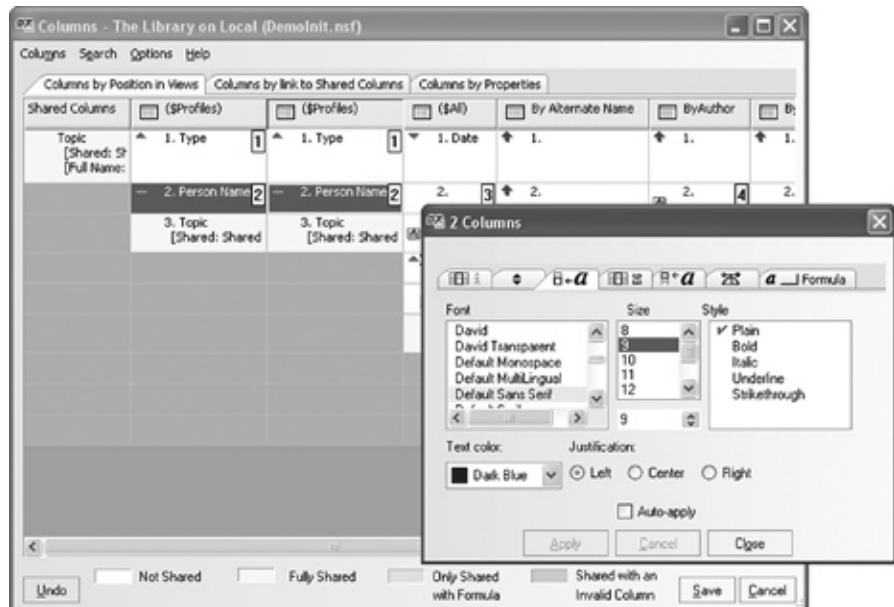

Choose the views you want to change, select the properties you want, click the update button and you're done. Modify all views for application-wide consistency in one step.

A Single Table Presentation for Views and Columns

See views and view columns laid out in an organized color-coded table. See how columns are organized by their position in the view or by their properties; from here you can easily analyze, move, copy and edit columns and their formulas to ensure maximum consistency and usability.

View Column Analyzer, Search and Replace

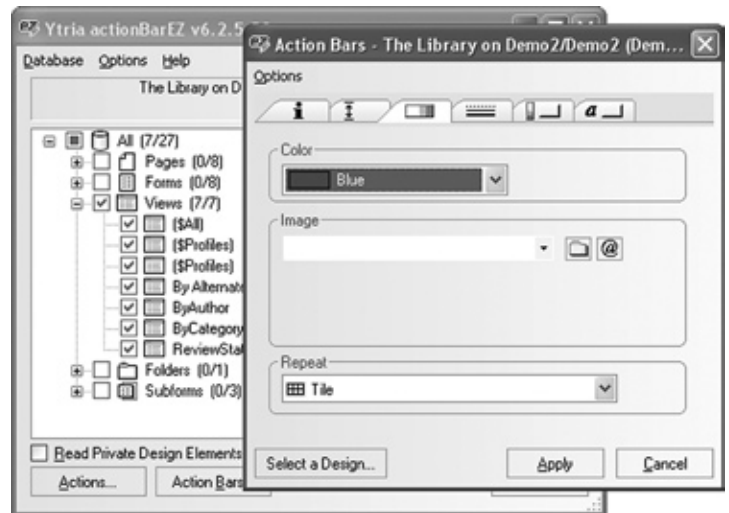

Quickly identify similar columns to ensure the consistency and organization of columns in an application. See exactly where similar columns are used (or missing). Also, use the search and replace feature to make extensive updates in all your view column formulas.

Do you want an action bar controller for any Notes and Domino application? Instantly give all your existing action bars a new modern "look and feel." Stop changing each action bar manually.

Total Action Bar Property Control

Choose the action bars you want to change, select the properties you want, click the update button and you're done. Modify all action bars for application-wide consistency in one step.

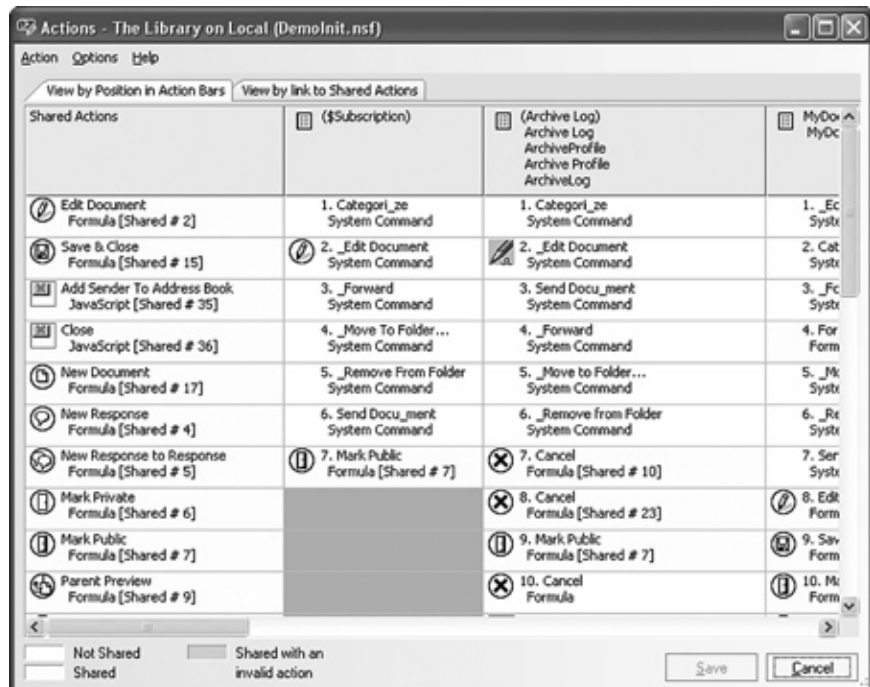

Ytria's viewEZ and actionBarEZ are much appreciated here because they can help us re-work the look of a database at a fraction of the time we would have spent doing it manually. Typically, work which would have taken us one week can now be done in one half-day. The rapidity with which we can make massive amounts of changes in the database makes us more daring; and we can now afford to try out different combinations before settling on a final design.

Andrew Magerman
Project Manager – Head of Development, Sobis Software

A Single Table Presentation for all your Actions

An organized, color-coded table lets you see exactly where and how a database's actions are being used. Analyze, move, copy and edit actions and their properties on a large scale in one place for maximum consistency and usability.

Giving more than 30 databases a new look and feel to meet Corporate Identity requirements with the basic Notes tool would have really been a pain. With actionBarEZ it was literally done in a snap.

Ingo Hefti
Kuehne + Nagel Mgmt AG

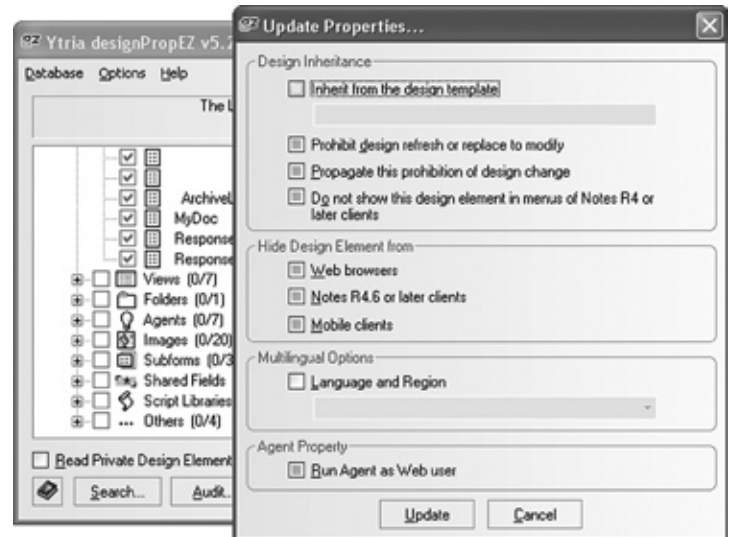

Are you looking for a way to flag an option (i.e. "Prohibit Refresh", or "Inherit from the design template") for all your design elements? Instantly see the properties for all the design elements.

Update Multiple Databases

Automate the Design Source flag options for all your databases, stop going through each of them manually. Create batch documents and automate this process for all your databases.

Ytria designPropEZ saved me 3 hours in its first day of full use as we were doing a release on over 50 databases.

NSRI London Branch

Complete Toolkits for Developers and Admins

Are you considering using more than one Ytria tool? The EZ Suite combines all Ytria tools in one affordable and convenient package. Quickly and easily install the ones you want, or all of them at once.

ez suite complete

Productivity tools to help developers and administrators accomplish more in less time.

- > scanEZ
- > aclEZ
- > agentEZ
- > signEZ
- > viewEZ
- > actionBarEZ
- > designPropEZ

We needed only two tools from Ytria, but because of the package deal we bought the whole package. The tools we have from Ytria do the job fully to our needs and whenever we need their technical support, they are very reliable and efficient!

Willem Leber
Senior developer, Metaware

ez suite admin

Powerful tools for managing, analyzing, and administering Lotus Notes and Domino databases on your server.

- > scanEZ
- > aclEZ
- > agentEZ
- > signEZ

The Ytria set of tools is really well-designed for Domino admins and developers. As a CLI, I should always say that managing Domino and Designer to a high-level is our goal, but in many situations spending a lot of time developing inefficient agents or modifying code or design properties can be really boring. For all these tasks Ytria is there to help you save time and do what you are supposed to do: make the whole thing work great.

Jérôme Deniau
CLI7 – Certified Lotus Instructor
Admin & Development, InForM

ez suite dev

Get things done faster and easier with tools specifically made for Lotus Notes and Domino developers.

- > scanEZ
- > signEZ
- > viewEZ
- > actionBarEZ
- > designPropEZ

All Our Tools are Built

By using Ytria Tools, we were able to ensure that BlogSphere V3 had a consistent look and feel throughout the entire application. To be able to do it with just a few mouse-clicks meant that we were able to make new releases much faster than before.

Declan Lynch
Lotus Notes Blogger,
<http://www.qtzar.com>

Compared to other development tools, Ytria offers affordable prices and ease of use. The continuous improvements and new features are impressive.

Art Zoutendijk
Senior Consultant, ECIT

- > **with backward compatibility**
You can use them with IBM Lotus Notes and Domino 4.6, 5, 6, 7 and 8.
- > **using the Unicode Standard**
You can use them on databases in any language such as Japanese, Russian, Chinese, etc.
- > **as add-ons**
You are never tied to our tools and are not required to use them for any future development.
- > **with an intuitive user interface**
You can get started within minutes of installation.
- > **with localization capabilities**
Easily get Ytria tools in a growing list of languages. No re-installation required.
- > **with Full Access administrators**
You can take advantage of this powerful Lotus Notes and Domino feature in all your administrative tasks.
